

DYNAMICS

QUANTITIES FOR THE DYNAMICS UNIT

For this unit copy and complete the table.

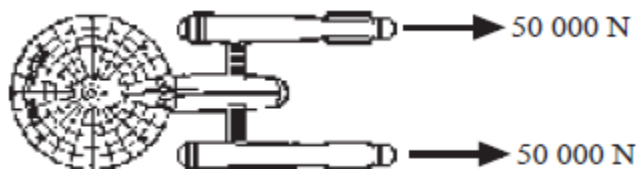

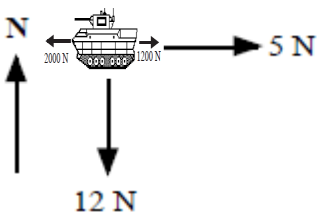

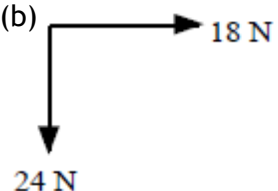

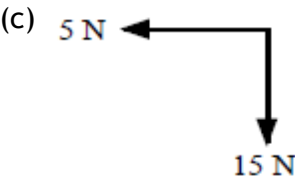

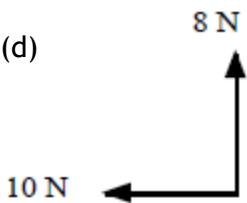

Quantity	Symbol	Unit	Unit Symbol	Scalar / Vector
Time	t	seconds	s	scalar
Speed	v	metres per second	ms^{-1}	scalar
Velocity	v	metres per second	ms^{-1}	vector
Acceleration	a	metres per second squared	ms^{-2}	vector
Distance	d	metre	m	scalar
Displacement	s	metre	m	vector
Force	F	Newton	N	vector
Weight	W	Newton	N	vector
Friction	F	Newton	N	vector
Gravitational Field Strength	g	Newtons per kilogram	Nkg^{-1}	vector
Energy	E	Joule	J	scalar
Work	E_w or W	Joule	J	scalar
Heat Energy	E_H	Joule	J	scalar
Gravitational Potential Energy	E_p	Joule	J	scalar
Kinetic Energy	E_k	Joule	J	scalar
Height	h	metre	m	scalar
Initial velocity	u	metres per second	ms^{-1}	vector
Final velocity	v	metres per second	ms^{-1}	vector
Average velocity	\bar{v}	metres per second	ms^{-1}	vector
Mass	m	kilogram	kg	scalar

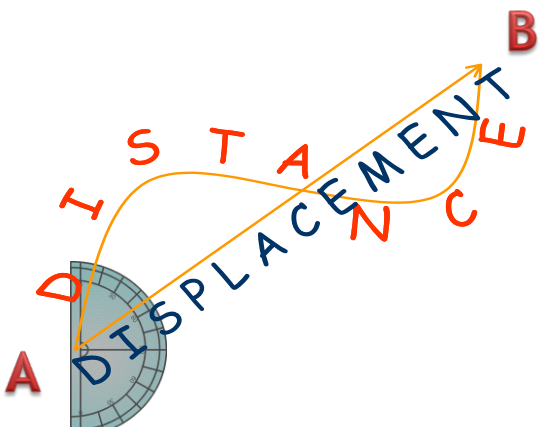

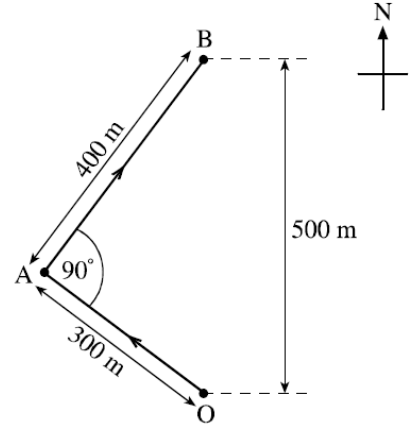

NB MAGNITUDE IS THE SIZE OF SOMETHING. THE MAGNITUDE OF A VECTOR QUANTITY IS THE SIZE, BUT NOT THE DIRECTION. KNOW THIS TERM, IT IS USED IN EXAMS.

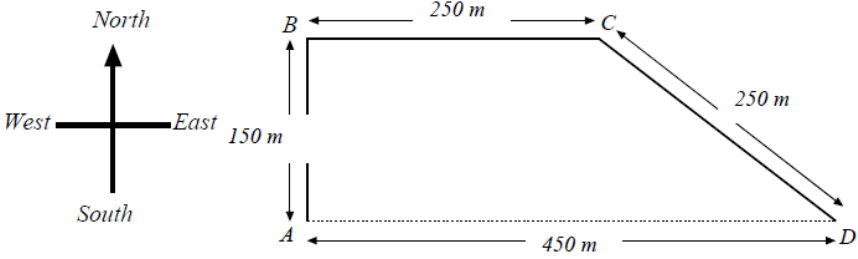

THE DYNAMICS UNIT IN NUMBERS

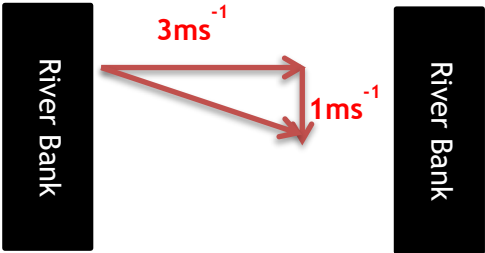

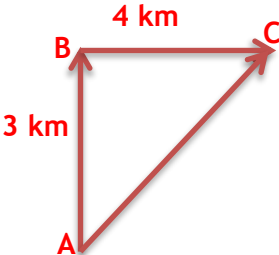

Quantity	Value
How many seconds in a minute?	60 s
How many seconds in an hour?	3600 s
What is the value of the gravitational field strength on Earth?	9.8 Nkg⁻¹
How many metres are there in a kilometre?	1000 m
How many metres are there in a mile?	1609 m
If 70 mph is equivalent to 31.29 ms ⁻¹ and 30 mph is equivalent to 13.41 ms ⁻¹ , what is the conversion factor to convert mph into ms ⁻¹ ?	÷2.2 or x0.45454545 etc

Vectors and scalars													
1.1	I can define scalar quantities and vector quantities.												
1.1.1	A scalar quantity is fully described by a magnitude and unit												
1.1.2	Define the term vector quantity. A vector quantity is fully described by a magnitude, unit and direction												
1.1.3	Describe the difference between vector quantities and scalar quantities. A vector quantity requires a direction to fully describe it												
1.2	I can identify vector and scalar quantities such as: force, speed, velocity, distance, displacement, acceleration, mass, time and energy.												
1.2.1	<p>Copy and complete the following table placing the quantities in the correct part of the table. <i>force, speed, velocity, distance, displacement, acceleration, mass, time and energy.</i></p> <table> <tr> <th>Scalar</th><th>Vector</th></tr> <tr> <td>Speed</td><td>Force</td></tr> <tr> <td>Distance</td><td>Velocity</td></tr> <tr> <td>Mass</td><td>Displacement</td></tr> <tr> <td>Time</td><td>Acceleration</td></tr> <tr> <td>Energy</td><td></td></tr> </table>	Scalar	Vector	Speed	Force	Distance	Velocity	Mass	Displacement	Time	Acceleration	Energy	
Scalar	Vector												
Speed	Force												
Distance	Velocity												
Mass	Displacement												
Time	Acceleration												
Energy													
1.3	I can calculate the resultant of two vector quantities in one dimension or at right angles.												

No.	CONTENT
1.3.1	Define the term “resultant” in terms of two vector quantities. The resultant of a number of forces is the single force which has the same effect as the several forces actually acting on the object.
1.3.2	<p>Explain how to calculate the resultant and direction of a pair of vectors at right angles.</p> <p>Scale Diagram- using the head to tail rule. Draw one vector to scale and on the head of the first vector draw the tail of the second. Join the direct route from tail to the final head. Find the length of this vector and scale up to get the resultant. Measure the angle with a protractor from N or horizontal or vertical. Mark this on your diagram</p> <p>Pythagoras. Redraw the diagram to follow the head to tail rule. Use Pythagoras to find the hypotenuse, which will be the resultant and use $\tan\theta$ to find the angle.</p> <p>Polar Coordinates (remember this method won't get you any intermediate marks so might be a better method of checking). Pol(x value, y value)= first answer is the resultant, second answer is the angle.</p>
1.3.3	<p>Determine the resultant of the following vectors</p> <div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <p>(a)</p>  </div> <div style="text-align: center;"> <p>(b)</p>  </div> </div> <div style="text-align: center; margin-top: 20px;"> <p>(c)</p>  </div> <p>(a) $F_1 + F_2 = F_R = 2000 + -1200 = 800N$ to the left (b) $F_1 + F_2 = F_R = 700 + -600 = 100N$ downwards (c) $F_1 + F_2 = F_R = 50\,000 + 50\,000 = 100\,000N$ to the right</p>
1.3.4	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;">  <p>(a)</p> </div> <div style="text-align: center;">  <p>(b)</p> </div> <div style="text-align: center;">  <p>(c)</p> </div> </div> <div style="text-align: center; margin-top: 20px;"> <p>(d)</p>  <p>(d)</p> </div> <p>Find the resultant of each of the pairs of vectors, remember to quote the direction.</p>

No.	CONTENT
	<p>By Pythagoras and $\tan \theta = \frac{\text{opp}}{\text{adj}}$ or on your calculator use rectangular to polar buttons (on a Casio calculator type Pol(x,y))</p> <p>a) $R^2 = a^2 + b^2 = 5^2 + 12^2 = 169$ $R=13\text{N @}67^\circ$ South of East b) $R^2 = a^2 + b^2 = 18^2 + 24^2 = 900$ $R=30\text{N @}53^\circ$ south of East c) $R^2 = a^2 + b^2 = 5^2 + 15^2 = 250$ $R=16\text{N @}72^\circ$ South of West d) $R^2 = a^2 + b^2 = 8^2 + 10^2 = 164$ $R=13\text{N @}39^\circ$</p>
1.4	I can determine displacement and/or distance using scale diagram or calculation.
1.4.1	<p>Explain the term distance. Distance is the total length of path travelled.</p> <p>Distance is a measure of how far an object has travelled</p>
1.4.2	<p>Explain the term displacement. Displacement is the length and direction travelled in a straight line from the starting point to the finishing point.</p> <p>OR</p> <p>The shortest distance between the start and the finish in a direction towards the finish.</p> <p>OR a measure of how far an object has travelled in a straight line from its starting point in the direction of the object from its start to finish point .</p> <p>OR by diagram</p> 
1.4.3	<p>The diagram shows the course taken by a boat during a race.</p> <p>The boat starts the race at O and sails to a marker buoy at A. The boat then turns through 90° and sails to a marker buoy at B.</p> <p>(i) Calculate the total distance travelled by the boat in going from O to B.</p> <p>The boat has travelled a total distance of 700 m</p> <p>(300 m + 400 m)</p> <p>(ii) On reaching the marker buoy at B, determine the displacement of the boat from O.</p> <p>The boat has a displacement of 500 m due North</p> 

No.	CONTENT
1.4.4	<p>An orienteer starts at A, runs to B, then C and finishes at D.</p>  <p>(i) Calculate the total distance travelled by the orienteer. distance = $150 + 250 + 250 = 650 \text{ m}$</p> <p>(ii) State the final displacement of the orienteer from point A. The final displacement is 450 m due East</p>
1.5	I can determine velocity and/or speed using scale diagram or calculation.
1.5.1	<p>Define the terms</p> <p>a) distance b) displacement</p> <p>Distance is “how far we’ve travelled”, symbol d, units metres, m, scalar quantity</p> <p>Displacement = “how far we’ve travelled in a straight line in a particular direction (from A to B)” symbol s, units, metres, m, vector quantity, must include the direction.</p>
1.5.2	<p>Define the terms...</p> <p>a) Speed is the distance travelled every second.</p> <p>b) Velocity is the displacement travelled every second in a certain direction</p>
1.5.3	<p>State the difference between speed and velocity.</p> <p>Speed is a scalar quantity and is the distance travelled every second. Velocity is a vector quantity and is the displacement travelled every second.</p>
1.5.4	<p>A cyclist travels 500 m in a straight line and then turns directly around and travels 300 m back.</p> <p>(a) State the magnitude of the displacement of the cyclist from the start. The cyclist travels 500m up and then 300m back, so displacement = $500 + -300 \text{ m} = 200 \text{ m straight ahead.}$</p> <p>(b) If the cyclist takes 4 minutes and twenty seconds to travel the complete distance, calculate the magnitude of the cyclist's.</p> <p>$t = 4 \text{ mins } 20\text{s} = 4 \times 60 + 20 = 260 \text{ s}$</p> <p>(i) speed and</p> $v = \frac{d}{t} = \frac{500 + 300}{260} = 3.1 \text{ ms}^{-1}$

No.	CONTENT
	<p>(ii) velocity.</p> $v = \frac{s}{t} = \frac{200}{260} = 0.77 \text{ ms}^{-1}$ <p>Magnitude so no need to give the direction but no marks off providing the direction is correct. (straight ahead)</p>
1.5.5	<p>A sculler is rowing his boat at 3 ms^{-1} <i>through the water</i> straight across a river which is flowing at 1 ms^{-1}.</p> <p>(a) Draw a vector diagram of these two motions.</p> <p>(b) Calculate the boat's velocity relative to the bank.</p>  <p>a)</p> <p>b) $R^2 = a^2 + b^2 = 3^2 + 1^2 = 10$ $R = 3\text{ms}^{-1} @ 72^\circ$ to the riverbank</p>
1.5.6	<p>On an orienteering course, a girl runs due north from point A to point B, a distance of 3 km. She then heads in an easterly direction for 4 km to point C.</p> <p>(a) Calculate the distance the girl ran from A to C.</p> <p>(b) Calculate the girl's displacement from point A when she reaches C.</p>  <p>(a) The girl has run a distance of 7 km</p> <p>(b) When the girl reaches C she is 5 km from the start at an angle of 53° from North.</p> $\tan \theta = \frac{\text{opp}}{\text{adj}} = \tan \theta = \frac{4}{3} \quad \theta = 53^\circ$

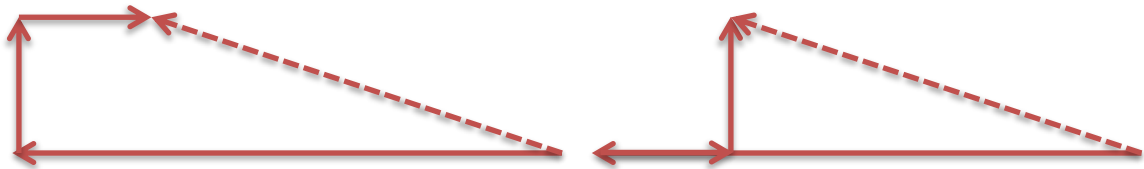

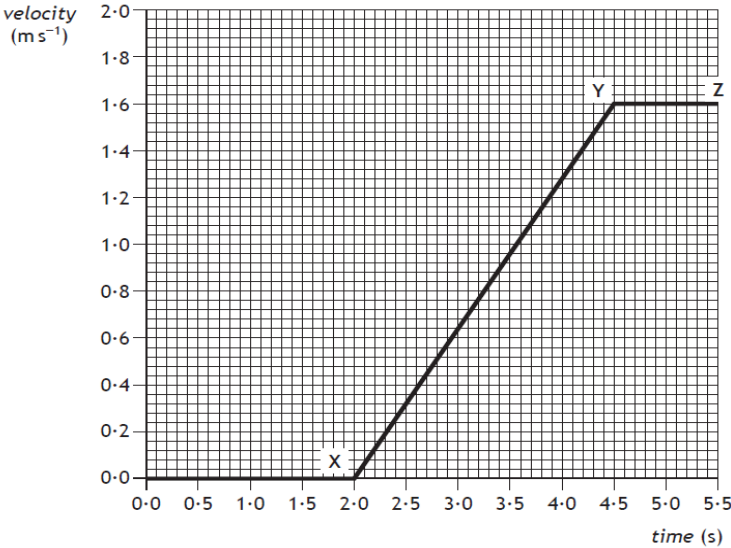

No.	CONTENT
1.5.7	<p>The distance between the wickets on a cricket pitch is 20.12 m. On one pitch, the wicket has a north-south orientation. A batsman scores three runs off one ball.</p> <div style="display: flex; align-items: center; justify-content: space-around;">  </div> <p>(a) Calculate the distance he ran. The cricketer has run a total distance of $3 \times 20.12 \text{ m} = 60.36 \text{ m}$</p> <p>(b) Calculate his final displacement if the wicket at which he batted is at the south end. His final displacement is 20.12 m South</p>
1.5.8	<p>Ben jogs around the centre circle of a football pitch.</p> <p>(i) Calculate the distance she travelled. Ben has jogged the circumference of the circle = 25 m</p> <p>(ii) State his displacement from the start. Ben arrives back where he started so his displacement is 0 m from the start</p> <p>Chris walks one and a half times around the circle in the same time</p> <p>(iii) Calculate the distance Chris travelled. Chris has walked 1.5 circumferences = $25 \times 1.5 = 38 \text{ m}$</p> <p>(iv) State Chris' displacement from the start. Chris' displacement is the diameter of the circle</p> <p>Circumference = πd</p> $d = \frac{25}{\pi} = 8.0 \text{ m}$ 
1.6	<p>I can perform calculations/ solve problems involving the relationship between speed, distance and time. ($d = vt$, and $d = \bar{v}t$)</p>
1.6.1	<p>A car travels 100 miles in $2\frac{1}{2}$ hours. Calculate its speed in mph?</p> $\bar{v} = \frac{d}{t}$ $\bar{v} = \frac{100 \text{ miles}}{2.5 \text{ hours}}$ $\bar{v} = 40 \text{ miles per hour}$

No.	CONTENT
1.6.2	<p>A train travels 120 km in 45 minutes.</p> <p>(i) Calculate the speed of the train in kmh^{-1}?</p> <div style="border: 1px solid red; padding: 10px; margin: 10px 0;"> <p>(i) $45 \text{ minutes} = \frac{3}{4} \text{ hours} = 0.75 \text{ hours}$</p> <p>$\bar{v} = \frac{d}{t} = \frac{120 \text{ km}}{0.75 \text{ h}} = 160 \text{ km/h}$</p> </div> <p>(ii) Calculate the speed of the train in ms^{-1}?</p> <div style="border: 1px solid red; padding: 10px; margin: 10px 0;"> <p>(ii) $45 \text{ minutes} = 40 \times 60 \text{ s} = 2700 \text{ s}$</p> <p>$120 \text{ km} = 120000 \text{ m}$</p> <p>$\bar{v} = \frac{d}{t} = \frac{120000 \text{ m}}{2700 \text{ s}} = 44.4 \text{ m/s}$</p> </div>
1.6.3	<p>A jet plane travels at an average speed of 300 ms^{-1}.</p> <p>(i) Calculate the distance the plane travels in an hour.</p> <p>$1 \text{ hour} = 60 \times 60 \text{ s} = 3600 \text{ s}$</p> <p>$d = vt = 300 \times 3600 = 1080000 \text{ m} = 1080 \text{ km}$</p> <p>(ii) Determine the time it would take to travel 500 km from Edinburgh to London.</p> <p>$500 \text{ km} = 500000 \text{ m}$</p> <p style="text-align: right;">$t = \frac{d}{v}$</p> <p style="text-align: right;">$t = \frac{500000 \text{ m}}{300} = 1667 \text{ s} = 27.8 \text{ minutes}$</p>
1.6.4	<p>A runner completes a 200 m race in 25 s. Calculate the runner's average speed.</p> <p style="text-align: center;">$\bar{v} = \frac{d}{t}$</p> <p style="text-align: center;">$\bar{v} = \frac{200}{25}$</p> <p style="text-align: center;">$\bar{v} = 8 \text{ ms}^{-1}$</p>
1.6.5	<p>An athlete takes 4 minutes 20 s to complete a 1500 m race. Calculate the average speed of the athlete in ms^{-1}.</p> <p>$t = 4 \text{ min } 20 \text{ s} = 4 \times 60 + 20 = 260 \text{ s}$</p> <p style="text-align: center;">$\bar{v} = \frac{d}{t}$</p> <p style="text-align: center;">$\bar{v} = \frac{1500}{260}$</p> <p style="text-align: center;">$\bar{v} = 5.8 \text{ ms}^{-1}$</p>

1.9.2	<p>(a) List various methods for measuring the instantaneous speed.</p> <p>(b) State of these methods is most accurate, <i>you must justify your answer</i></p> <p>(a) You can measure instantaneous speed by using light gates connected to an electronic timer. You measure how long it takes the object to move a small distance. You calculate the instantaneous speed by dividing the distance by the time (the time must be very small).</p> <p>(b) You can time how long it takes a vehicle to pass a point. Find the instantaneous speed by using the equation</p> $\text{instantaneous speed} = \frac{\text{length of vehicle}}{\text{time to pass a point}}$ <p>Using an electronic timer is better as it removes any human error caused by reaction time.</p>
1.9.3	<p>An arrow of length 0.8 m is shot from a bow.</p>  <p>A student designs an experiment to measure the instantaneous speed of the arrow, as it leaves the bow. The student places a light gate connected to a timer, as shown below.</p> <p>The student states that the speed of the arrow can be found from</p> $\text{speed of the arrow} = \frac{\text{length of arrow}}{\text{time on timer}}$ <p>(i) Explain why the method used by the student does not give the correct value for the speed of the arrow as it leaves the bow. The length of the arrow is too great and during the time the arrow passes through the light gate the instantaneous speed can have changed. The time must be very short to measure instantaneous speed.</p> <p>(ii) Suggest how the experiment could be modified to enable the speed of the arrow as it leaves the bow to be found. Two light gates a few cm apart and measure the gap time. Or add a mask and raise the light gates so that only the mask blocks the light gates. This might have problems with the flight of the arrow.</p>

	<p>c) the average speed of the vehicle as it passes down the slope? distance d and time on timer 3</p> <p>d) the instantaneous speed at the bottom of the slope? length of card / time on timer 2</p> <p>e) What additional equipment is required to complete these measurements? Rule to measure the card length.</p>

Velocity- time graphs

2.1

I can draw velocity-time graphs for objects from recorded or experimental data.

2.1.1

(a) On graph paper, draw a velocity-time graph of the race car’s journey.
(b) Using the graph, describe the motion of the race car over the 80 seconds.

Time (s)	0	10	20	30	40	50	60	70	80
Speed (m/s)	5	5	20	35	50	50	50	25	0

(c) Using the graph you have drawn, calculate

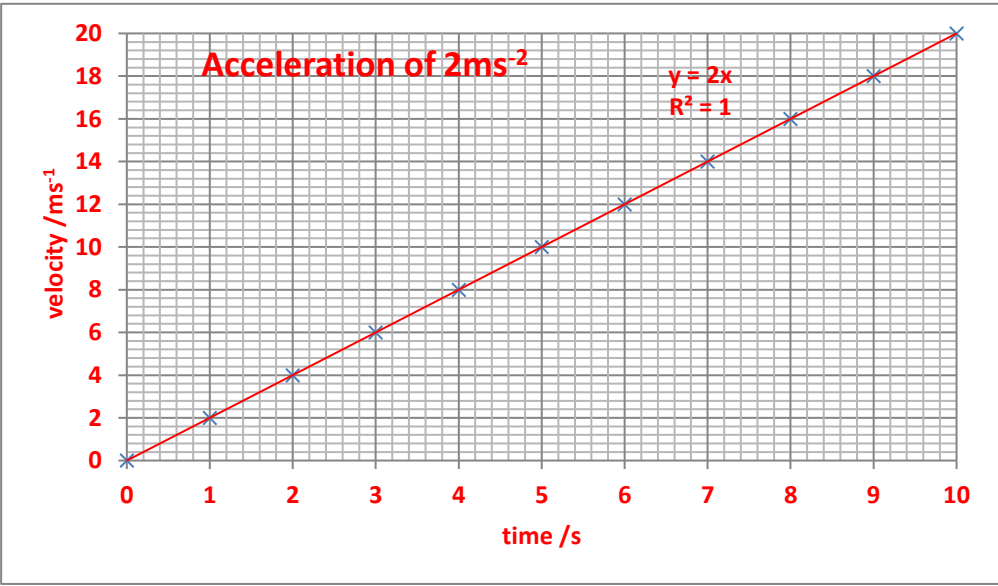

(i) The acceleration between 10 and 40 s.
(ii) The total distance travelled by the race car.
(iii) The average speed during the 80 seconds.

Time (s)	Speed (m/s)
0	5
10	5
20	20
30	35
40	50
50	50
60	50
70	25
80	0

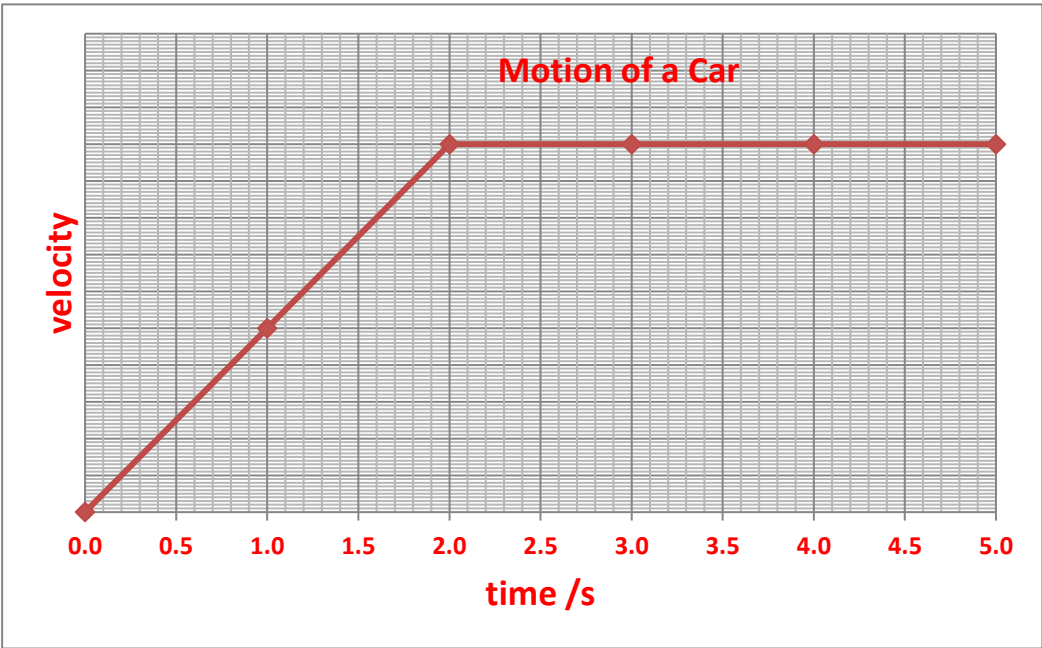

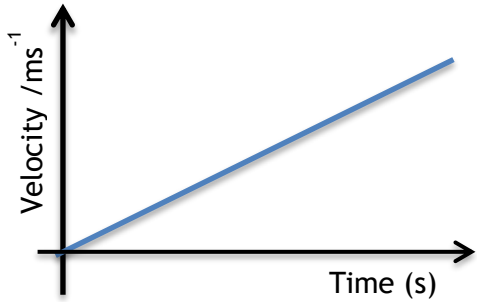

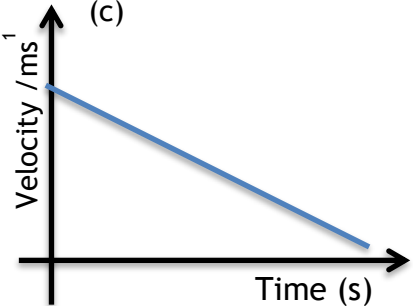

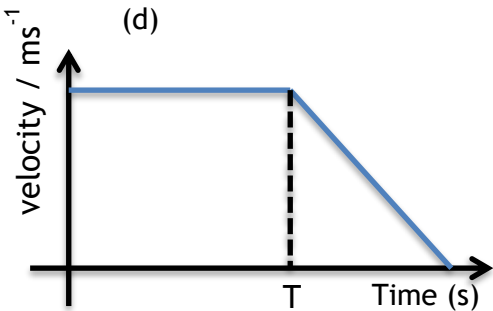

b. The car takes 10 s to start moving. It accelerates from 10 s to 40s and then from 40 s to 60 s moves at constant velocity. From 60 s to 80s the car has a constant uniform deceleration or negative acceleration until it reaches rest.

c.

$$a = \frac{v - u}{t} = \text{gradient}$$
$$a = \frac{50 - 5}{30} = 1.5 \text{ ms}^{-2}$$

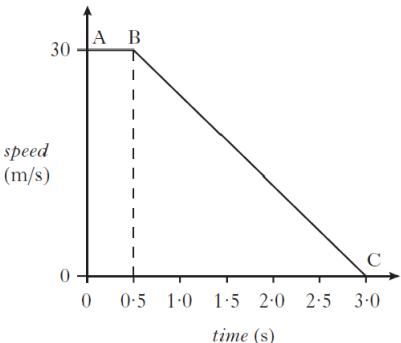

No.	CONTENT
	<p>d. Total distance = area under a v-t graph Area 1 + area 2 + area 3 + area 4 $(40 \times 5) + (\frac{1}{2} \times 30 \times 45) + (20 \times 50) + (\frac{1}{2} \times 20 \times 50) = 2375 \text{ m}$</p> <p>e.</p> $\bar{v} = \frac{d}{t}$ $\bar{v} = \frac{2375}{80} = 30 \text{ ms}^{-1}$
2.1.2	<p>Draw a labelled speed-time graph showing an object</p> <p>(a) accelerating at 2 ms^{-2}, (b) travelling at a steady velocity of 6 ms^{-1}, (c) accelerating at -5 ms^{-2}.</p> <p>a)</p>  <p>b)</p>

Acceleration

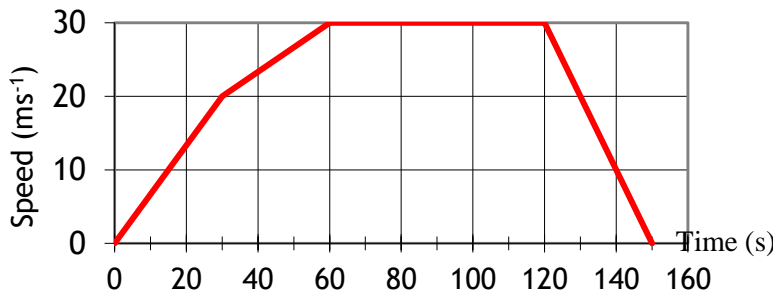

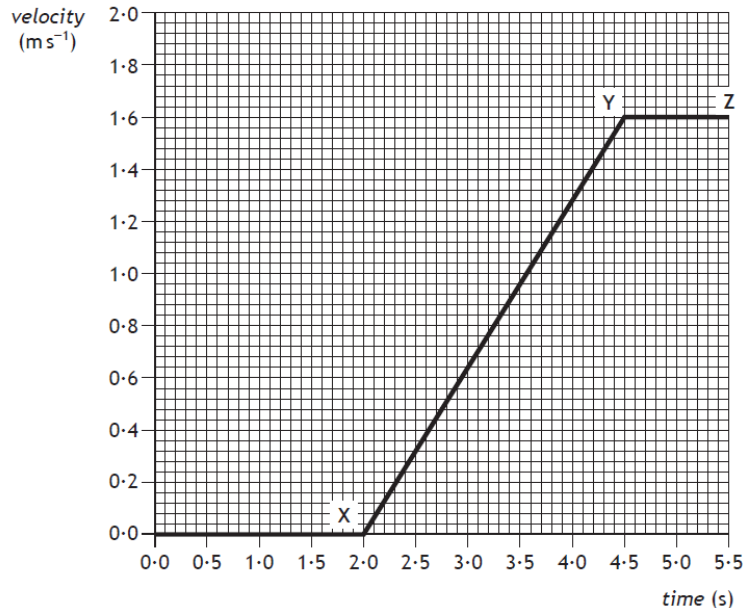

No.	CONTENT
3.1	I can define acceleration as the final velocity subtract the initial velocity divided by the time for the change
3.1.1	State the meaning of the term “acceleration”. Acceleration is the rate of change of velocity OR the change in velocity per second. It is measured in metres per second squared.
3.1.2	Explain what is meant by a <i>uniform acceleration of 1.4 ms^{-2}</i> <i>A uniform acceleration of 1.4 ms^{-2} means that every second the velocity <u>increases</u> by 1.4 ms^{-2}</i>
3.2	I can use the relationship involving acceleration, change in speed and time ($a = \Delta v/t$).
3.2.1	A Jaguar can reach 27 ms^{-1} from rest in 9.0 s , calculate its acceleration. $a = \frac{v - u}{t}$ $a = \frac{27 - 0}{9} = 3 \text{ ms}^{-2}$
3.2.2	The space shuttle reached 1000 ms^{-1} , 45 s after launch, calculate its acceleration. $a = \frac{v - u}{t}$ $a = \frac{1000 - 0}{45} = 22 \text{ ms}^{-2}$
3.2.3	Starting from rest, a flea accelerates to 1.2 ms^{-1} in a time of 0.001 s . Calculate the acceleration of the flea. $a = \frac{v - u}{t}$ $a = \frac{1.2 - 0}{0.001} = 1200 \text{ ms}^{-2}$
3.2.4	A car reaches a velocity of 30 ms^{-1} from a velocity of 18 ms^{-1} in 6 s . Calculate its acceleration. $a = \frac{v - u}{t}$ $a = \frac{30 - 18}{6} = 2 \text{ ms}^{-2}$
3.2.5	A train moving at 10 ms^{-1} increases its speed to 45 ms^{-1} in 10 s . Calculate its acceleration. $a = \frac{v - u}{t}$ $a = \frac{45 - 10}{10} = 3.5 \text{ ms}^{-2}$

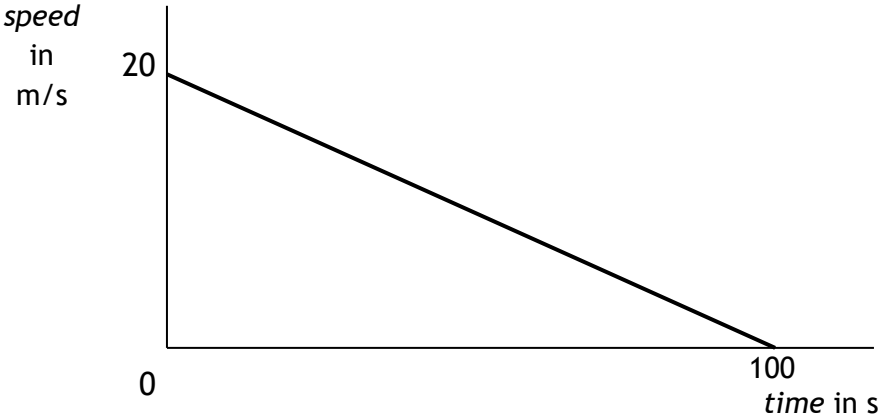

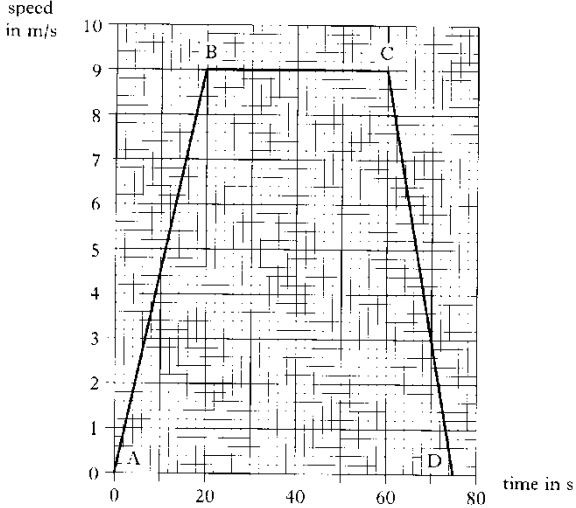

No.	CONTENT
3.2.6	<p>A bullet travelling at 240 ms^{-1} hits a wall and stops in 0.2 s. Calculate its acceleration.</p> $a = \frac{v - u}{t}$ $a = \frac{0 - 240}{0.2} = -1200 \text{ ms}^{-2}$
3.2.7	<p>A car travelling at 20 ms^{-1} brakes and slows to a halt in 8 s. Calculate its acceleration.</p> $a = \frac{v - u}{t}$ $a = \frac{0 - 20}{8} = -2.5 \text{ ms}^{-2}$
3.3	<p>I can use appropriate relationships to solve problems involving acceleration, initial velocity (or speed) final velocity (or speed) and time of change.</p>
3.3.1	<p>State the formula linking velocity and acceleration. Explain what each letter stands for and the units of each.</p> $a = \frac{\Delta v}{t}$ <p>a=acceleration in ms^{-2}, Δv = change in velocity in ms^{-1}, t = time for the change in seconds</p>
3.3.2	<p>A girl is riding a bicycle. She starts at rest, and accelerates to 20 ms^{-1} in 8.0 seconds, calculate her acceleration.</p> $a = \frac{\Delta v}{t}$ $a = \frac{20 - 0}{8} = 2.5 \text{ ms}^{-2}$
3.3.3	<p>A car increases its velocity from 30 ms^{-1} to 80 ms^{-1} in 20 seconds. Calculate its acceleration.</p> $a = \frac{v - u}{t}$ $a = \frac{80 - 30}{20} = 2.5 \text{ ms}^{-2}$

3.5.3

The apparatus shown in the Figure above is used to find the acceleration of a vehicle moving along a linear air track.

State two ways of modifying the experiment to produce an acceleration which is double the acceleration.

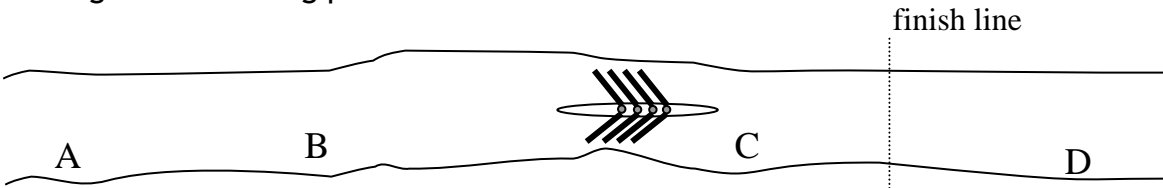

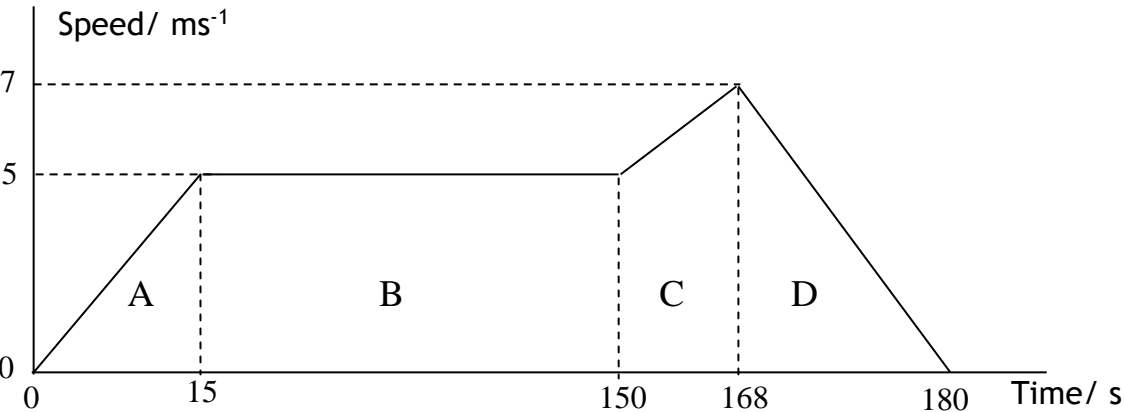

- 1) Double the mass on the end of the pulley (doubling the Force)
- 2) Halve the mass of the vehicle

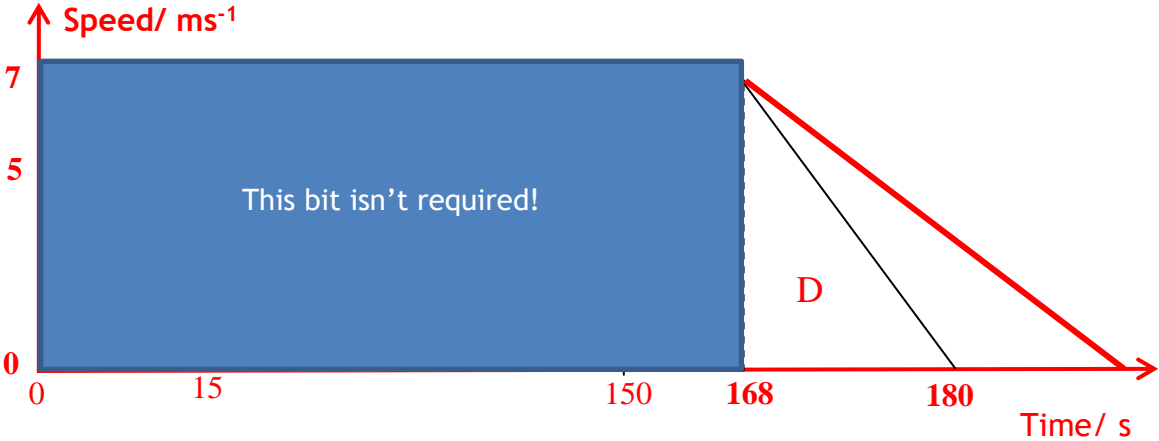

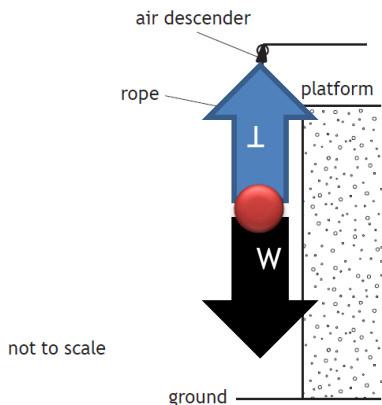

Newton's Laws

4.1	I can give applications and use Newton's laws and balanced forces to explain constant velocity (or speed), making reference to frictional forces of this.
4.1.1	<p>(a) State the meaning of the term force. A force is a push or a pull</p> <p>(b) State the effects a force have on an object. A force can make an object change its speed, its shape, or its direction of travel.</p>
4.1.2	Describe how you can measure a force. You can measure a force using a spring balance or Newtonbalance dynamometer. The extension of the spring is directly proportional to the applied force.
4.1.3	<p>(a) State what is meant by the term friction.</p> <p>Friction is a contact force which opposes motion. It is caused when one surface slides (or tries to slide) over another.</p> <p>(b) State the effect of friction on movement?</p> <p>Friction opposes motion and causes things to slow down. Friction will try to stop a moving object.</p>

No.	CONTENT
4.1.4	<p>List ways of reducing the force of friction between two surfaces.</p> <ul style="list-style-type: none"> • Make the surfaces smoother • Put a lubricant between the two surfaces e.g. oil • Reduce the mass/weight pushing the surfaces together • Make the surfaces smoother. ... • Lubrication is another way to make a surface smoother. • Make the object more streamlined. • Reduce the forces acting on the surfaces. • Reduce the contact between the surfaces. • Roll the bodies instead of sliding them.
4.1.5	<p>State ways you increase the force of friction between objects.</p> <ul style="list-style-type: none"> • Create a “rougher” or more adhesive point of contact. • Press the two surfaces together harder. • Stop any relative motion. • Remove lubrication between the two surfaces. • Remove wheels or bearings to create sliding friction. • Increase the fluid viscosity.
4.1.6	<p>Explain some of the ways friction is used in motor racing. Include at least two examples of where friction is increased and one where it is decreased.</p> <p>Air friction or drag is important because it determines how well the car slips through the air, as well as how well it plants itself to the ground - most of this effect comes from wings.</p> <p>Friction in the engine and driveline are important. Less friction will mean less loss of power and less heat, which will improve performance. And though less heat will mean better reliability, often times it becomes a balance between the two as some methods of protection will increase resistance</p> <p>Friction is also the important for the grip with the road. The tyres are the only part of the car in contact with the racing surface. Tyres obtain their grip through friction. With zero friction the car would be unable to propel itself forward, brake or turn.</p>
4.1.7	<p>Explain, in terms of friction how basic brakes work.</p> <p>Brakes usually use friction between two surfaces pressed together to convert the kinetic energy of the moving object into heat. The brakes will wear away due to the high friction and these will need to be replaced.</p>
4.1.8	<p>(a) If you increase the unbalanced force acting on an object while its mass remains constant, what happens to its acceleration?</p> <p>As $F=ma$ as F increases, a will increase if mass remains constant</p> <p>(b) If you increase the mass of an object, while keeping the unbalanced force the same, what happens to its acceleration?</p> <p>As $m=F/a$ as m increases, and F remains constant then a will decrease</p>

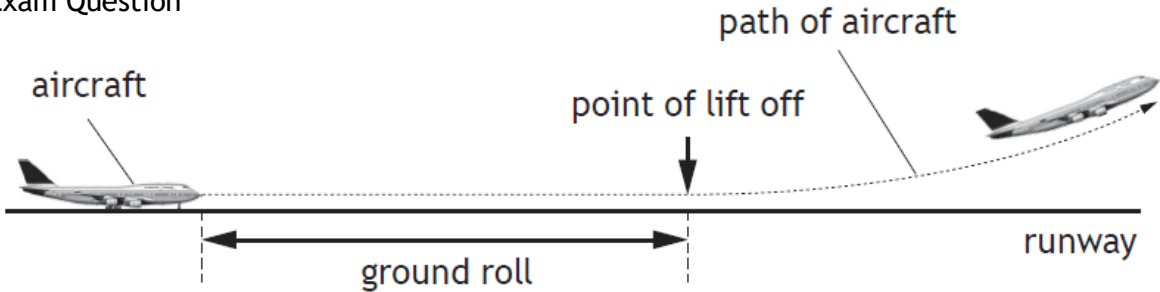

No.	CONTENT
4.1.9	<p>State Newton's First Law of Motion.</p> <p>An object will remain at rest or move at steady speed in a straight line unless acted upon by an unbalanced force.</p> <p>Or</p> <p>Unless an unbalanced force acts on an object the object will move at constant velocity (which means constant speed in a straight line)</p> <p>Or</p> <p>An object will remain at rest or move at constant velocity unless acted upon by an unbalanced force.</p>
4.1.10	<p>State Newton's Second Law of Motion.</p> <p>Force=mass \times acceleration</p> <p>$F = m a$</p>
4.1.11	<p>Use Newton's first law to explain why a passenger in a train appears to be pushed backwards when the train suddenly starts, and why they appear to be pushed forwards when the train brakes.</p> <p>When the train starts, the passenger remains stationary until the seat produces a force to accelerate them. Relative to the train, they appear to move backwards. When the train stops, the passenger continues to move forward until the seat applies a force to decelerate them. They appear to move forwards because of this.</p> <p>When a train suddenly starts the people on the train will remain at rest as there is no force acting on them. The train will accelerate as the engine provides an unbalanced force. This makes the people appear to move backwards.</p> <p>When a train brakes, the people on the train will continue to move at their original speed until something provides a force to decelerate them.</p> <p>Hence the people appear to be pushed forward but are just remaining at the same speed.</p>
4.1.12	<p>A boy of mass 45 kg pulls a sledge of mass 15 kg up a slope at a constant velocity of 0.5 ms^{-1}. Are the forces acting on the sledge balanced or unbalanced? Explain your answer.</p> <p>The forces are balanced as the boy is moving at constant velocity.</p>
4.1.13	<p>A motor is used to apply a force of 120 N to a box of mass 30 kg. The box moves at a constant speed across a horizontal surface.</p> <div data-bbox="879 1711 1430 1899" data-label="Image"> <p>The diagram shows a rectangular box on a horizontal surface. To the right of the box is a motor. A horizontal arrow points from the motor towards the box, with the label '120 N' above it. The box is labeled 'box' and the motor is labeled 'motor'.</p> </div> <p>State what you can tell about the forces on this box. As the vehicle is going at constant speed the forces must be balanced.</p> <p>State any other forces acting on the block. Friction between the surface and the box. The weight of the block</p>

4.5.4	 <p>A person sits on a chair which rests on the Earth. The person exerts a downward force on the chair.</p> <p>State the reaction force.</p> <p>The chair exerts an upwards force on the person.</p>
4.6	I can use Newton's laws to explain free-fall and terminal velocity.
4.6.1	<p>State the meaning of the term free-fall.</p> <p>free fall is any motion of a body where the force of gravity is the only force acting upon it causing an acceleration.</p>
4.6.2	<p>State the meaning of the term terminal velocity. When the force of gravity acting on a body is balanced by the frictional forces on the body, the forces are balanced and the body moves at a constant speed, called the terminal velocity.</p>
4.6.3	<p>(i) State what happens to an object as it is dropped from a height above the Earth's surface. The object will initially accelerate at 9.8 ms^{-2}, the frictional forces will rapidly increase as the speed of the object increases, until the object travels at terminal velocity.</p> <p>(ii) State the cause of this. The force of gravity pulls objects toward the Earth causing an acceleration, the acceleration decreases to zero when the object moves at terminal velocity as forces are balanced, according to Newton's First Law</p>
4.6.4	<p>State the effects of an unbalanced (resultant) force on an object. An unbalanced force causes an acceleration on the body</p>
4.6.5	<p>A car is travelling at a constant speed along a flat level road.</p> <p>(a) State what you can say about the forces on the car. The forces are balanced</p> <p>(b) An unbalanced force is added to the car, state what happens to the motion of the car. The car will accelerate</p>

4.6.9

The diagram above shows the velocity time graph for a parachutist during her fall from when she exits the plane to when she lands.

(i) Describe the motion of the parachutist at each point

point	Forces and Motion
A	The skydiver accelerates at 9.8ms^{-2}
B	The skydiver accelerates with a reduced acceleration than at the start.
C	The skydiver falls at constant speed, terminal velocity.
D	The skydiver has a large deceleration (or negative acceleration) and is slowed down.
E	The skydiver falls at constant speed, terminal velocity
F	The skydiver experiences a great negative acceleration (slowing down)

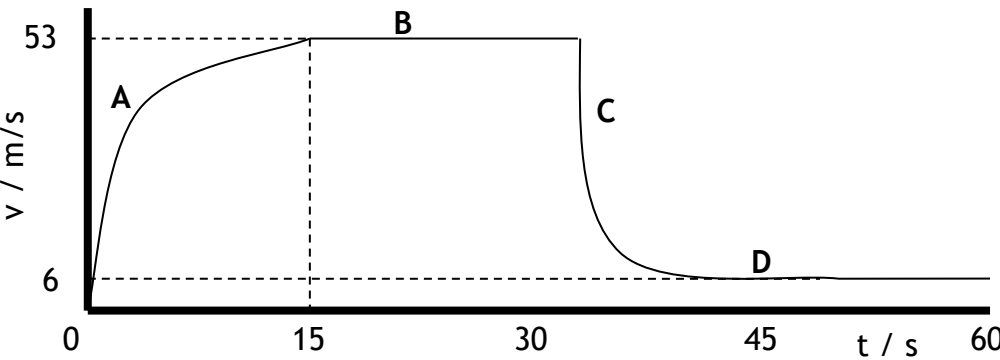

(ii) State at which points she has reached terminal velocity.

C & E

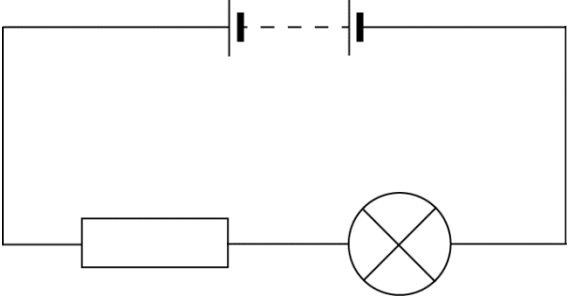

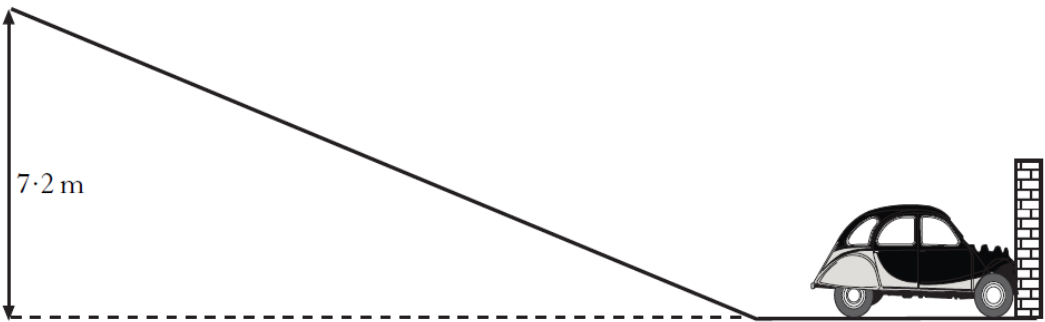

(iii) Explain in terms of forces and Newton's Laws of motion why the parachutist reaches terminal velocity.

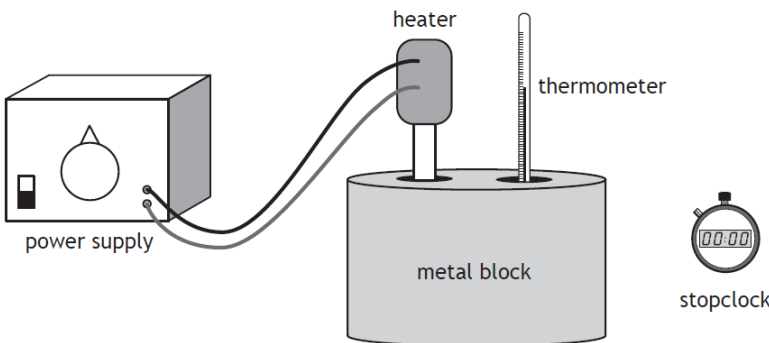

No.	CONTENT												
	<p>The downwards force of weight is equal to the opposing frictional forces on the skydiver, and according to Newton's First Law an object will remain at constant velocity unless acted upon by an unbalanced force. This constant velocity is called terminal velocity.</p> <p>(iv) Explain how can there be two points where she reaches terminal velocity when the weight of the parachutist hasn't changed.</p> <p>Frictional forces increase with speed. The first terminal velocity occurs when the weight equals to the drag/ frictional forces/ air resistance and the parachute is closed. When the parachute opens the frictional forces are greater than the weight this causes the skydiver to slow down which reduced the frictional forces until they reach the same magnitude as the weight. When they are balanced a new terminal velocity is reached but this is less than before.</p> <p>(v) Explain which of Newton's Laws of Motion explains the different parts of the graph.</p> <table border="1"> <thead> <tr> <th>point</th><th>Forces and Motion</th></tr> </thead> <tbody> <tr> <td>A</td><td> <p>Newton's 2nd Law $F=ma$</p> <p>$F=\text{weight}$, $m = \text{mass of the skydiver and kit}$, $a=\text{acceleration}$.</p> <p>Initial velocity in the vertical direction is zero, the object accelerates under the force of gravity at 9.8ms^{-2}. 4.6.11	<p>Explain the results of these experiments:</p> <p>(a) When released from the same height on Earth, a hammer will hit the ground before a feather. On Earth both objects initially accelerate at 9.8 ms^{-2}. As speed increases upwards frictional forces increase. There is a greater upwards frictional force on the feather than the hammer as it is less streamlined so the feather will reach terminal velocity in a shorter time, or will accelerate with a smaller acceleration than the hammer if terminal velocity is not reached.</p> <p>(b) When released from the same height on the moon, a hammer and feather will hit the ground at the same time.</p> <p>On the Moon both objects initially accelerate at 1.6 ms^{-2}. As there is no atmosphere on the moon there is no gas to provide frictional forces on either objects so they will continue to accelerate at 1.6 ms^{-2} until reaching the ground.</p>										
4.6.12	<p>The diagram shows the vertical motion of a skydiver as he returns from a parachute jump</p>  <p>(a) State the two vertical forces acting on the sky diver during the jump. weight and air resistance or drag</p> <p>(b) State the value of the terminal velocity of the sky diver during the jump. 53 ms^{-1}</p> <p>(c) Explain, in terms of vertical forces, the motion of the sky diver at each of the points indicated on the graph.</p> <table border="1" data-bbox="343 1489 1348 2063"> <thead> <tr> <th>point</th><th>Forces and Motion</th></tr> </thead> <tbody> <tr> <td>A</td><td>At A weight is greater than drag/ air resistance so the skydiver accelerated with a smaller acceleration than at the start.</td></tr> <tr> <td>B</td><td>At B Weight = drag so the skydiver falls at constant speed, terminal velocity of 53 ms^{-1}</td></tr> <tr> <td>C</td><td>At C drag forces are much greater than the weight (the parachute has been opened) so there is a high deceleration (or negative acceleration)</td></tr> <tr> <td>D</td><td>At D Weight = drag so the skydiver falls at constant speed, terminal velocity of 6 ms^{-1}</td></tr> </tbody> </table>	point	Forces and Motion	A	At A weight is greater than drag/ air resistance so the skydiver accelerated with a smaller acceleration than at the start.	B	At B Weight = drag so the skydiver falls at constant speed, terminal velocity of 53 ms^{-1}	C	At C drag forces are much greater than the weight (the parachute has been opened) so there is a high deceleration (or negative acceleration)	D	At D Weight = drag so the skydiver falls at constant speed, terminal velocity of 6 ms^{-1}
point	Forces and Motion

Energy	
5.1	I can state the Law of Conservation of Energy.
5.1.1	State the Law of Conservation of Energy. Energy can neither be created nor destroyed, it can only be transferred or transformed
5.2	I can identify and explain energy conversions and transfer.
5.2.1	Describe the energy conversions when a pendulum swings back and forth. At the top of the swing the pendulum has maximum gravitational potential energy and no kinetic energy. At the bottom of the swing the pendulum has max kinetic energy and no gravitational potential energy. In between these position the pendulum has the same total energy but it distributed between E_k and E_p
5.2.2	Describe the energy conversions and transfers as a parachutist falls to Earth, from the time they jump from the plane to them safely landing on the ground As the parachutist falls initially from the plane the E_p is at its maximum, E_k is at its minimum. As the parachutist falls E_p decreases and E_k increases. Not all the E_p is transferred to E_k as drag forces increase with increasing speed. Work is done against increasing frictional forces creating heat in the air. When the parachute is opened E_k is converted to E_H through friction/drag E_p continues to be lost as heat. On landing E_k is converted to heat and sound as work is done bringing the parachutist to a stop. .
5.2.3	Describe the energy transfers and conversions when a light bulb is connected to a cell and the switch closed. A cell is a store of chemical potential energy, when the switch closes this is transformed to electrical energy in the wires. The electrical energy is transformed to heat and light in the bulb.
5.2.4	When an object is dropped from a height of 4.0 m it is found that not all its gravitational potential energy is transferred into kinetic energy. Explain this observation. As speed increases frictional forces on the object increase so work is done on the object by these frictional forces heating up the object and the air surrounding it as it falls. Energy is neither created or destroyed but it is $E_p = E_k + E_w(\text{as heat})$
5.2.5	Explain why all the electrical energy from a kettle element does not go in to heating the water in the kettle. As the temperature rises in the water the heat is transferred to the body of the kettle and the surrounding air, as well as the water in the kettle.
5.2.6	State the energy transfer as four women row in an Olympic boat race. Chemical energy in the women, transferred to kinetic energy in the oars, transferred to kinetic energy moving the boat forward. Some energy will be transferred as heat due to friction and air resistance.
5.3	I can apply the principle of 'conservation of energy' to examples where energy is transferred between stores.

	<p>(vi) Calculate the speed of the lorry at the bottom of the hill.?</p> $E_k = \frac{1}{2}mv^2$ $8.3 \times 10^5 = \frac{1}{2} \times 5000 \times v^2$ $\frac{2 \times 8.3 \times 10^5}{5000} = v^2$ $v = 18.2 \text{ ms}^{-1}$
5.5.2	<p>Explain why the kinetic energy of the lorry at the bottom of the slope is not equal to the gravitational potential energy at the top of the slope. Some of the energy is converted to heat due to friction.</p>
5.5.3	<p>State where energy “losses” occur in the circuit below</p> <p>Energy is lost as heat in the battery, resistor, lamp and potentially wires.</p> 
5.6	<p>I can define gravitational potential energy.</p>
5.6.1	<p>Define the term gravitation potential energy. The energy an object possesses due to its position above the ground.</p>
5.6.2	<p>State the relationship used to calculate the gravitational potential energy, include what each term means and the units used to measure each term</p> $E_p = mgh$ <p>E_p = gravitational potential energy in Joules m = mass in kilograms g = gravitational field strength in Newtons per kilogram h = height in metres</p>
5.7	<p>I can solve problems on involving gravitational potential energy, mass, gravitational field strength and height.</p>
5.7.1	<p>A mass of 4kg is released from a height of 2m. Calculate the gravitational potential energy of the mass before it is released.</p> $E_p = mgh$ $E_p = 4 \times 9.8 \times 2 = 78.4 \text{ J}$
5.7.2	<p>An object has a gravitational potential energy of 502J. It is dropped from a height of 20 m.</p> $E_p = mgh$ $502 = m \times 9.8 \times 20$ $\frac{502}{196} = m = 2.6 \text{ kg}$

No.	CONTENT
5.7.3	<p>A chairlift raises a skier of mass 60 kg to a height of 250 m. Calculate the potential energy gained by the skier.</p> $E_p = mgh$ $E_p = 60 \times 9.8 \times 250 = 1.5 \times 10^5 \text{ J}$
5.7.4	<p>A brick of mass 3 kg rests on a platform 25 m above the ground on a building site.</p> <p>a) Calculate the potential energy stored in the brick.</p> $E_p = mgh$ $E_p = 3 \times 9.8 \times 25 = 740 \text{ J}$ <p>b) If the brick falls 25 m to the ground, determine the potential energy it will lose. 740 J.</p> <p>c) State the form of energy gained by the brick as it falls. Kinetic energy (plus heat energy)</p>
5.7.5	<p>Estimate how much gravitational potential energy you would gain if you were lifted 30m up to the top of a fun-ride.</p> $E_p = mgh$ <p>Assuming $m=50 \text{ kg}$</p> $E_p = 50 \times 9.8 \times 30 = 14700 \text{ J}$
5.7.6	<p>An apple, mass 100 g, has 300 J of potential energy at the top of the Eiffel Tower. Calculate the height of the Eiffel Tower.</p> $E_p = mgh$ $m=100\text{g}=0.1 \text{ kg}$ $300 = 0.1 \times 9.8 \times h$ $\frac{300}{0.98} = h = 330 \text{ m}$
5.7.7	<p>An astronaut of mass 70 kg climbs to a height of 5 m on the moon and gains 560 J of gravitational potential energy.</p> <p>(i) Determine the gravitational field strength on the moon.</p> $E_p = mgh$ $560 = 70 \times g \times 5$ $\frac{560}{70 \times 5} = g = 1.6 \text{ Nkg}^{-1}$ <p>(ii) If the same experiment were carried out on Earth state whether the astronaut would gain less, more or the same gravitational potential energy, you must justify your answer. Gain more E_p as $g=9.8 \text{ Nkg}^{-1}$ so for 5 m she would gain 3430 J</p>
5.8	<p>I can define kinetic energy as the energy an object has because of its speed.</p>
5.8.1	<p>State the meaning of the term kinetic energy.</p> <p>Energy an object possesses by being in motion.</p>

No.	CONTENT
5.8.2	<p>State how the kinetic energy of an object changes when</p> <p>(i) it's speed increases, and Ek increases. Doubling speed quadruples the Ek</p> <p>(ii) it's mass increases. Ek increase (but doubling mass double the Ek)</p>
5.8.3	<div style="display: flex; align-items: flex-start;"> <div style="flex: 1;">  </div> <div style="flex: 1; padding-left: 10px;"> <p>A cyclist is travelling along a straight road. The graph shows how the velocity of the cyclist varies with time.</p> <p>State where the kinetic energy of the cyclist is at its greatest and explain your answer.</p> <p>As the mass of the cyclist is not changing then the Ek will be greatest when the speed/velocity is greatest. This occurs at P.</p> </div> </div>
5.9	<p>I can use $E_k = \frac{1}{2}mv^2$ to solve problems involving kinetic energy, mass and speed</p>
5.9.1	<p>You are provided with an air track and vehicles, a light gate and timer and some elastic bands. Describe how you could use this apparatus to establish how potential energy provided affects the velocity of the vehicle. Include details of any measurements you would take and any additional measuring equipment needed.</p> <div style="text-align: center; margin: 10px 0;">  </div> <p>Set up a catapult across the runway by stretching a large elastic band between the dowel rods (or clamp stands). Firmly fix a single vertical dowel rod on the trolley and measure its width with a rule. Adjust the height of the elastic so that the vertical rod will catch the middle of it.</p> <p>Place the trolley on the runway. Pull it back a measured distance against the catapult so that the rubber is stretched. Release the trolley so that it is projected by the catapult along the runway and passes through the light gate. The width of the dowel rod, divided by the time to pass through the light gate will give the speed of the trolley. Add another elastic band, of the same thickness and length and repeat. Plot a graph of no. of elastic bands (an indication of the potential energy given to the trolley) against velocity squared. This should yield a straight line graph through the origin indicating the potential energy stored in the elastic bands is proportional to the kinetic energy (v^2).</p> <p>You need to measure, the dowel width, the time for this to pass through the light gate, the number of elastic bands, the distance it is pulled back. Calculate</p>

No.	CONTENT
	$\text{velocity} = \frac{\text{dowel width}}{\text{time to pass the light gate}}$
5.9.2	<p>Calculate the kinetic energy of the following:</p> <p>a) a 5.0 kg bowling ball moving at 4.0 ms^{-1}</p> $E_k = \frac{1}{2}mv^2$ $E_k = \frac{1}{2} \times 5 \times 4^2 = 40 \text{ J}$ <p>b) a 50.0 kg skier moving at 20.0 ms^{-1}</p> $E_k = \frac{1}{2}mv^2$ $E_k = \frac{1}{2} \times 50 \times 20.0^2 = 1.0 \times 10^4 \text{ J}$ <p>c) a 0.020 kg bullet moving at 100.0 ms^{-1}.</p> $E_k = \frac{1}{2}mv^2$ $E_k = \frac{1}{2} \times 0.020 \times 100.0^2 = 100 \text{ J}$
5.9.3	<p>a) Calculate the kinetic energy an 800 kg car has when travelling at a velocity of 10.0 ms^{-1}.</p> $E_k = \frac{1}{2}mv^2$ $E_k = \frac{1}{2} \times 800 \times 10.0^2 = 4.0 \times 10^4 \text{ J}$ <p>b) If it doubles its velocity to 20.0 ms^{-1}, calculate its new kinetic energy.</p> $E_k = \frac{1}{2}mv^2$ $E_k = \frac{1}{2} \times 800 \times 20.0^2 = 1.6 \times 10^5 \text{ J}$ <p>Doubling the velocity quadruples the kinetic energy of an object</p>
5.9.4	<p>A cyclist who is pedalling down a slope reaches a speed of 15 ms^{-1}. The cyclist and her cycle together have a mass of 80 kg.</p> <p>a) Calculate the total kinetic energy.</p> $E_k = \frac{1}{2}mv^2$ $E_k = \frac{1}{2} \times 80 \times 15^2 = 9000 \text{ J}$ <p>b) Name two sources of this kinetic energy. From the mechanical energy (kinetic energy) of the cyclist travelling down the slope; and the conversion of gravitational potential energy to kinetic energy as it moves down the slope.</p>

SQA SG CREDIT 2012 Q9

While repairing a school roof, workmen lift a pallet of tiles from the ground to the top of the scaffolding. This job is carried out using a motorised pulley system.

The pallet and tiles have a total mass of 230 kg.

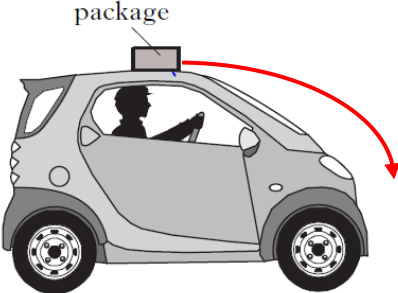

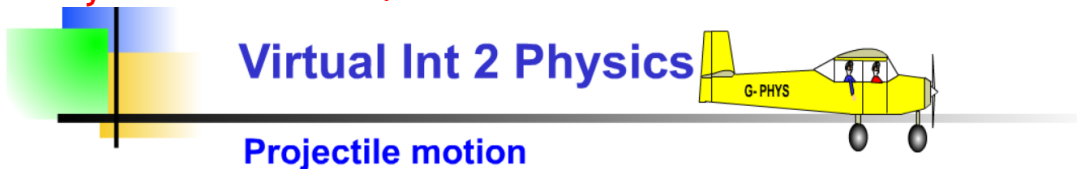

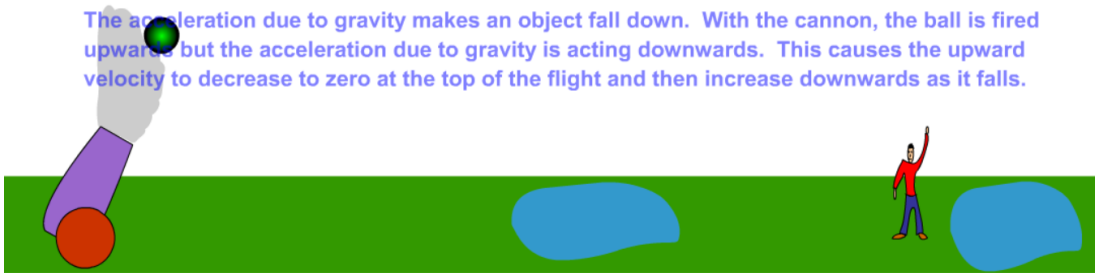

- Calculate the weight of the pallet and tiles.
- State the minimum force required to lift the pallet and tiles.
- The pallet and tiles are lifted to a height of 12 m. Calculate the gravitational potential energy gained by the pallet and tiles.
- When the tiles are being unloaded onto the scaffolding, at a height of 12 m, one tile falls. The tile has a mass of 2.5 kg.
 - Calculate the final speed of the tile just before it hits the ground. Assume the tile falls from rest.
 - Explain why the actual speed is less than the speed calculated in (d)(i).

5.10.15	<p>Figure 1 shows a pendulum in its rest position A. The pendulum bob has a mass of 0.3 kg. The bob is pulled to one side as shown in Figure 2 and held at position B, which is 0.8 m above the rest position.</p> <p>The bob is released from position B and swings to and fro until it comes to rest.</p> <p>a) Calculate the gain in potential energy of the bob when it is moved from position A to position B.</p> $E_p = mgh = 0.3 \times 9.8 \times 0.8 = 2.4 \text{ J}$ <p>b) State in which position the bob has greatest kinetic energy. At the bottom of the swing where the E_p has been transformed to E_k</p> <p>c) Estimate the maximum speed of the bob. If all the gravitational potential energy is converted to E_k we can work out the speed.</p> $E_{p \text{ lost}} = E_{k \text{ gained}} = \frac{1}{2}mv^2$ $2.4 = \frac{1}{2} \times 0.30 \times v^2$ $\frac{2 \times 2.4}{0.30} = v^2$ $v = 4.0 \text{ ms}^{-1}$ <p>d) Describe the energy changes which take place from the time the bob is released until it comes to rest. The bob has gravitational E_p at the top of the swing, but as the speed is zero at this point it has zero E_k, as the pendulum drops the E_p is converted to E_k. As the pendulum bob moves up the other side the kinetic energy is converted back into gravitational potential energy. This would continue forever but it doesn't so there must be a further energy transformation. Some of the energy is converted to heat through friction with the pendulum and the air. This is why the pendulum eventually stops.</p>
5.10.16	<p>An object is dropped from a height of 0.75 m from the surface of the Earth. Calculate the velocity on landing. (No you don't need to know the mass, but start with the two formulae)</p> $E_{p \text{ lost}} = E_{k \text{ gained}}$ $mgh = \frac{1}{2}mv^2 \qquad 2gh = v^2$ $v = \sqrt{2gh} = \sqrt{2 \times 9.8 \times 0.75} = 3.8 \text{ ms}^{-1}$

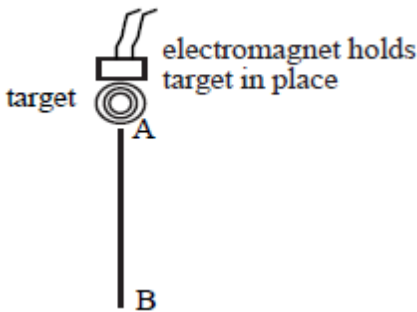

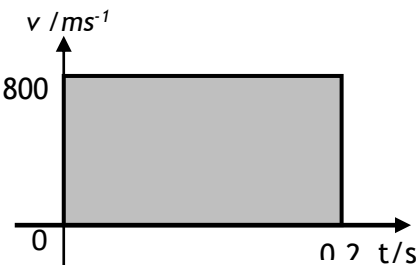

Projectile Motion

No.	CONTENT
6.1	I can explain projectile motion
6.1.1	Explain the term projectile. A projectile is an object thrown at an angle so that it has both horizontal and vertical motion.
6.1.2	Explain what is special about the motion of a projectile. It has both horizontal and vertical motion. Horizontal motion is steady/constant speed, vertically it accelerates downwards at 9.8 ms^{-2}
6.1.3	SG - Credit - 2011 - Q13  <p>A driver accidentally leaves a package on the top of a vehicle. When he notices he brakes suddenly and the package falls off the car.</p> <p>(i) Sketch the path taken by the package as it falls off the car.</p> <p>(ii) Describe both the horizontal and vertical motions of the package in as much detail as possible. Horizontally the package moves forward at constant velocity/speed at the same speed that the package leaves the car (the speed the vehicle was travelling when the package left the top of the car- the speed the car was travelling before braking. Vertically the package moves with constant acceleration of 9.8 ms^{-2} from an initial vertical velocity of zero.</p>
6.2	I can use appropriate relationships to solve problems involving projectile motion from a horizontal launch, including the use of motion graphs.
6.2.1	A stone thrown horizontally from a cliff lands 24 m out from the cliff after 3.0 s. Find: <p>a) the horizontal speed of the stone</p> $v = \frac{d}{t} = \frac{24}{3} = 8 \text{ ms}^{-1}$ <p>b) the vertical speed at impact.</p> $v = u + at$ $v = 0 + 9.8 \times 3 = 29 \text{ ms}^{-1}$
6.2.2	A ball is thrown horizontally from a high window at 6 ms^{-1} and reaches the ground after 2.0 s. Calculate <p>a) the horizontal distance travelled</p> $v = \frac{d}{t}$ $6 = \frac{d}{2}$ $d = 6 \times 2 = 12 \text{ m}$ <p>b) the vertical speed at impact.</p> $v = u + at$ $v = 0 + 9.8 \times 2.0 = 20 \text{ ms}^{-1}$

6.7.6	<p>A rocket is fired horizontally from a cliff top at 40 ms^{-1} to the right. The rocket hits the sea below after 4 s.</p> <p>a) State the rocket's horizontal component of velocity just before it hits the sea. As the rocket is fired the horizontal motion remains constant for the journey at 40 ms^{-1} to the right</p> <p>b) Calculate the rocket's range (horizontal displacement). $s_h = v_h t$ $s_h = 40 \times 4 = 160 \text{ m}$</p> <p>c) Calculate the rocket's vertical component of velocity just before it hits the sea. $a = \frac{v_v - u_v}{t}$ $9.8 = \frac{v_v - 0}{4}$ $v_v = 9.8 \times 4 = 39 \text{ ms}^{-1}$</p> <p>d) Sketch the velocity-time graph for the rocket's vertical motion.</p>  <p>e) Use the graph to determine the rocket's vertical displacement (the height of the cliff). Area under the v-t graph is the vertical displacement $\text{height} = \frac{1}{2}bh$ $\text{height} = \left(\frac{1}{2} \times 4.0 \times 39\right) = 190 \text{ m}$</p>

6.8	I can explain satellite orbits in terms of projectile motion, horizontal velocity and weight.
6.8.1	<p>Explain how gravity keeps a satellite in orbit.</p> <p>The force of gravity provides the force needed to maintain the stable orbit of both planets around a star and also of moons and artificial satellites around a planet.</p> <p>For an object to remain in a steady, circular orbit it must be travelling at the right speed. Too slow and it will spiral to earth, too high and it will leave the orbit..</p>
6.8.2	<p>Explain why a satellite needs a horizontal motion and a vertical motion to stay in orbit.</p> <p>If a projectile has enough speed, it will move through space constantly falling towards the Earth in free fall. With the high constant horizontal speed the projectile falls around the curvature of the Earth. Without a horizontal speed the satellite would fall to Earth.</p> <p>Without the vertical motion (constant acceleration) the satellite would move away from the Earth at constant speed, leaving the gravitational field.</p>

6.8.3 OEQ	<p>A group of students are watching a video clip of astronauts on board the International Space Station (ISS) as it orbits the Earth.</p>  <p>One student states, 'I would love to be weightless and float like the astronauts do on the ISS.'</p> <p>Using your knowledge of physics, comment on the statement made by the student. The key to this question are in the words <i>weightless</i> and <i>float</i></p> <p>Possible answers</p> <ol style="list-style-type: none"> 1) The members on the ISS are not weightless but are in freefall 2) Weightless would mean there is no force of gravity on the object 3) Freefall is falling under the acceleration due to gravity 4) The ISS is only between 330 km (205 mi) and 410 km (255 mi) up (that's the approximate distance from Lockerbie to Aberdeen) 5) At the altitude of ISS (about 400 km), the gravitational field strength is about 0.885 g, or 8.7ms^{-2}. 6) Use $W=mg$ for this calculation 7) (Not needed until Higher but to find this value you are using $F = \frac{GMm}{r^2}$) where r is the value from the centre of the Earth to the ISS 8) Not floating but all objects are falling at the same rate so that to an observer on the ISS a ball appears to float 9) The ISS is like a satellite with a horizontal velocity of approximately 27600 kmh^{-1} 10) Discuss the motion of a projectile with constant horizontal velocity and constant vertical acceleration 11) Discuss Newton's Thought Experiment. 12) Finish with a flourish - would you like to be an astronaut on the ISS?
